Chapter 8

Problems

1.
$$P{0 \le X \le 40} = 1 - P{|X - 20| > 20} \ge 1 - 20/400 = 19/20$$

4. (a)
$$P\left\{\sum_{i=1}^{20} X_i > 15\right\} \le 20/15$$

(b)
$$P\left\{\sum_{i=1}^{20} X_i > 15\right\} = P\left\{\sum_{i=1}^{20} X_i > 15.5\right\}$$

$$\approx P\left\{Z > \frac{15.5 - 20}{\sqrt{20}}\right\}$$

$$= P\{Z > -1.006\}$$

$$\approx .8428$$

6. If X_i is the outcome of the i^{th} roll then $E[X_i] = 7/2$ $Var(X_i) = 35/12$ and so

$$P\left\{\sum_{i=1}^{79} X_i \le 300\right\} = P\left\{\sum_{i=1}^{79} X_i \le 300.5\right\}$$

$$\approx P \left\{ N(0,1) \le \frac{300.5 - 79(7/2)}{(79 \times 35/12)^{1/2}} \right\} = P\{N(0,1) \le 1.58\} = .9429$$

Self-Test Problems and Exercises

4.

8.4. If X is the number produced at factory A and Y the number produced at factory B, then

$$E[Y - X] = -2, \quad Var(Y - X) = 36 + 9 = 45$$

$$P\{Y - X > 0\} = P\{Y - X \ge 1\}$$

$$= P\{Y - X + 2 \ge 3\} \le \frac{45}{45 + 9} = 45/54$$

4. 若X為工廠A所生產之數量且Y為工廠B所生產之數量,則

$$E[Y-X] = -2$$
, $Var(Y-X) = 36+9=45$
 $P\{Y-X>0\} = P\{Y-X\ge 1\} = P\{Y-X+2\ge 3\} \le \frac{45}{45+9} = 45/54$

7.

8.7. If X is the time required to service a machine, then

$$E[X] = .2 + .3 = .5$$

Also, since the variance of an exponential random variable is equal to the square of its mean, we have

$$Var(X) = (.2)^2 + (.3)^2 = .13$$

Therefore, with X_i being the time required to service job i, i = 1, ..., 20, and Z being a standard normal random variable, it follows that

$$P\{X_1 + \dots + X_{20} < 8\} = P\left\{\frac{X_1 + \dots + X_{20} - 10}{\sqrt{2.6}} < \frac{8 - 10}{\sqrt{2.6}}\right\}$$

$$\approx P\{Z < -1.24035\}$$

$$\approx .1074$$

7. 若 X 表維修一部機器所需時間,則

$$E[X] = 0.2 + 0.3 = 0.5$$

而且,指數隨機變數的變異數等於其平均數的平方,所以

$$Var(X) = (0.2)^2 + (0.3)^2 = 0.13$$

因此,令 X_i 表服務工作i所花時間 $i=1,\dots,20$,且Z為一個標準常熊隨機變數,則

$$P\{X_1 + \dots + X_{20} < 8\} = P\left\{\frac{X_1 + \dots + X_{20} - 10}{\sqrt{2.6}} < \frac{8 - 10}{\sqrt{2.6}}\right\}$$

$$\approx P\{Z < -1.24035\}$$

$$\approx .1074$$
